

Computer System Design & Application

计算机系统设计与应用A

陶伊达 (TAO Yida)

taoyd@sustech.edu.cn

Lecture 8

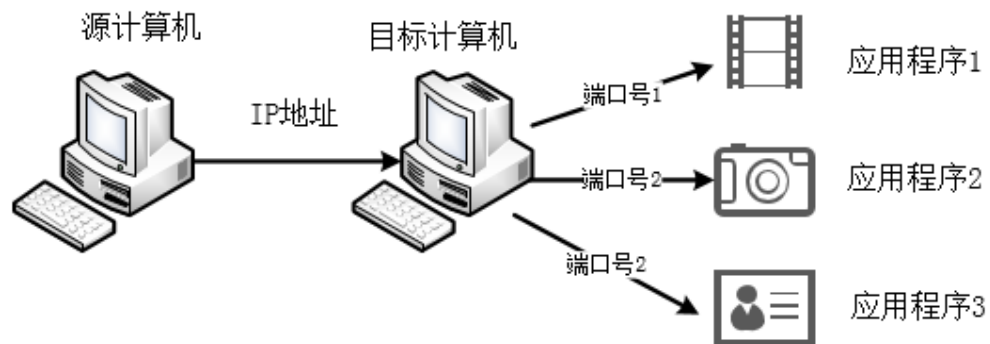

- Network Basics
- Network Protocols
- Socket Programming
- Getting Web Data

Networking

Networking is a concept of connecting two or more computing devices together so that we can share resources

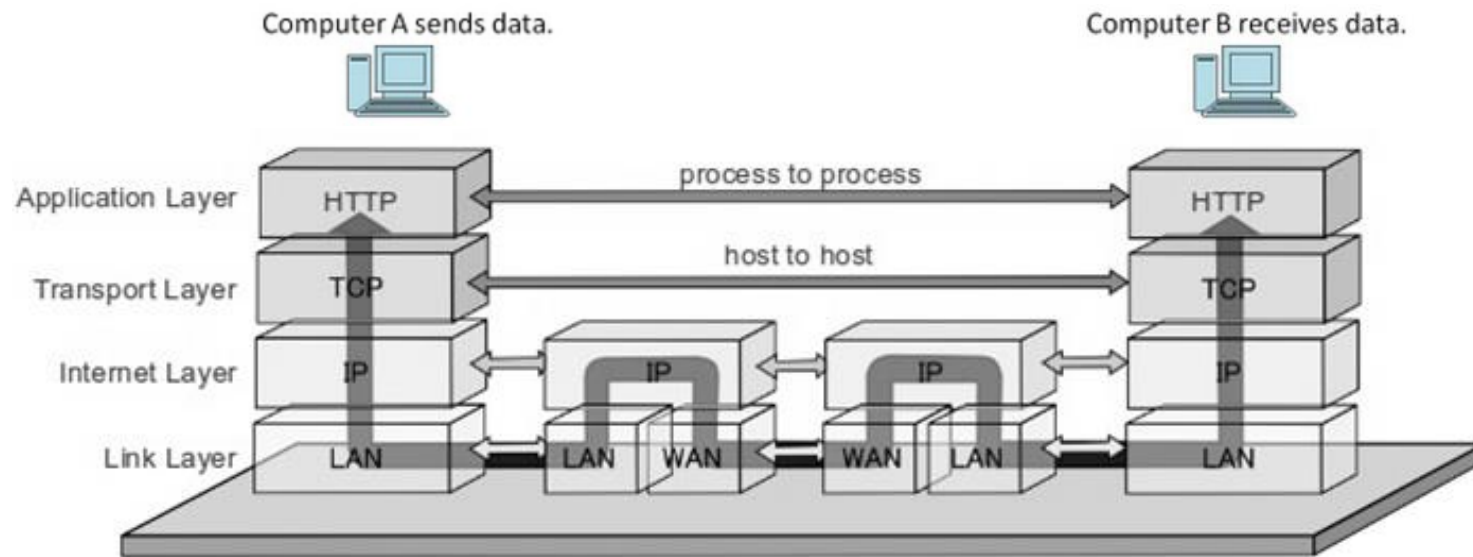

Networking Terminology

- **IP address:** a unique address that distinguishes a device on the internet or a local network
- **Domain name:** a human-friendly version of an IP address that you enter in browser (translated by DNS)
- **Port number:** a number used to identify different applications/processes uniquely

Network Architecture

- Network architecture refers to a network's structural and logical layout. It describes how the network devices are connected and the rules that govern data transfer between them

<https://www.elprocus.com/tcp-ip-protocol-architecture-and-its-layers/>

The background features a series of concentric circles, some solid and some dashed, in a light gray color. A large, solid green oval is positioned in the center, containing the main text. A thick, dark gray curved line sweeps across the lower-left portion of the green oval.

How do devices communicate
with each other?

Network Protocols

- A network protocol (网络协议) is a set of established rules that dictate how to format, transmit and receive data so that computer network devices can communicate, regardless of the differences in their underlying infrastructures, designs or standards.
- To successfully send and receive information, devices on both sides of a communication exchange must accept and follow protocol conventions
- Without computing protocols, computers and other devices would not know how to engage with each other.

Application Layer Protocols

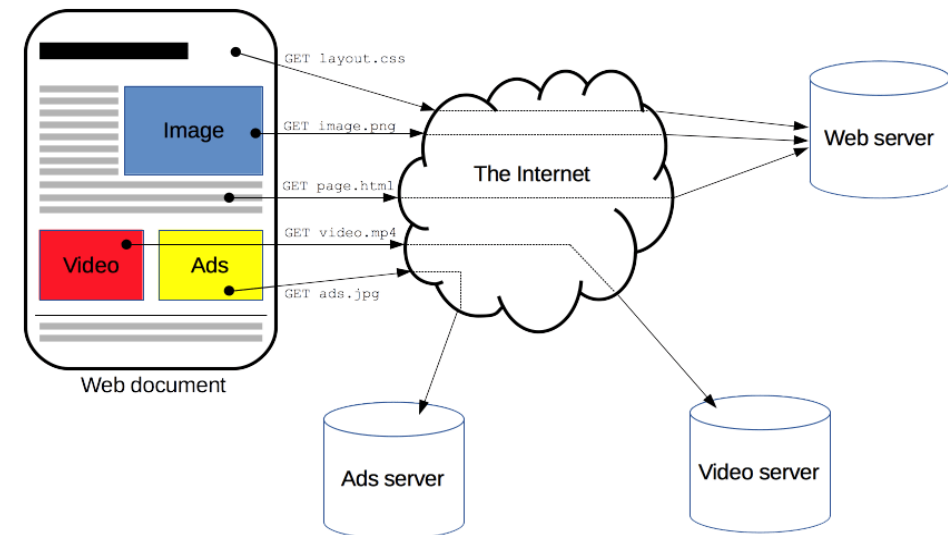

- Each Internet application has a different application protocol, which describes how the data for that particular application are transmitted.
- A port number helps a computer decide which application should receive an incoming piece of data

Well-known port numbers are reserved and we can no longer use them for other purposes

Port number	Protocol that uses it
21	File Transfer Protocol (FTP)
25	Simple Mail Transfer Protocol (SMTP)
80 & 8080	HyperText Transfer Protocol (HTTP)
110	Post Office Protocol v3 (POP3)
143	Internet Message Access Protocol (IMAP)
443	HyperText Transfer Protocol over SSL/TLS (HTTPS)
666	Doom Multiplayer game
989	Secure FTP (SFTP)
23	Telnet
25565	Minecraft Multiplayer Default Port
27015	Source Engine Multiplayer Default Port

HTTP (Hypertext Transfer Protocol)

- HTTP is a protocol for fetching resources such as HTML documents. It is the foundation of any data exchange on the Web
- It is a client-server protocol, which means requests are initiated by the client, usually the [web browser](#).
- [Web server](#) responds with an HTTP response

<https://developer.mozilla.org/en-US/docs/Web/HTTP/Overview>

HTTP Request Commands

Table 1 HTTP Commands

Command	Meaning
GET	Return the requested item
HEAD	Request only the header information of an item
OPTIONS	Request communications options of an item
POST	Supply input to a server-side command and return the result
PUT	Store an item on the server
DELETE	Delete an item on the server
TRACE	Trace server communication

GET /index.html HTTP/1.1	Request Line
Date: Thu, 20 May 2004 21:12:55 GMT	General Headers
Connection: close	
Host: www.myfavoriteamazingsite.com	
From: joeblow@somewebsitesomewhere.com	Request Headers
Accept: text/html, text/plain	
User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)	Entity Headers
	HTTP Request
	Message Body

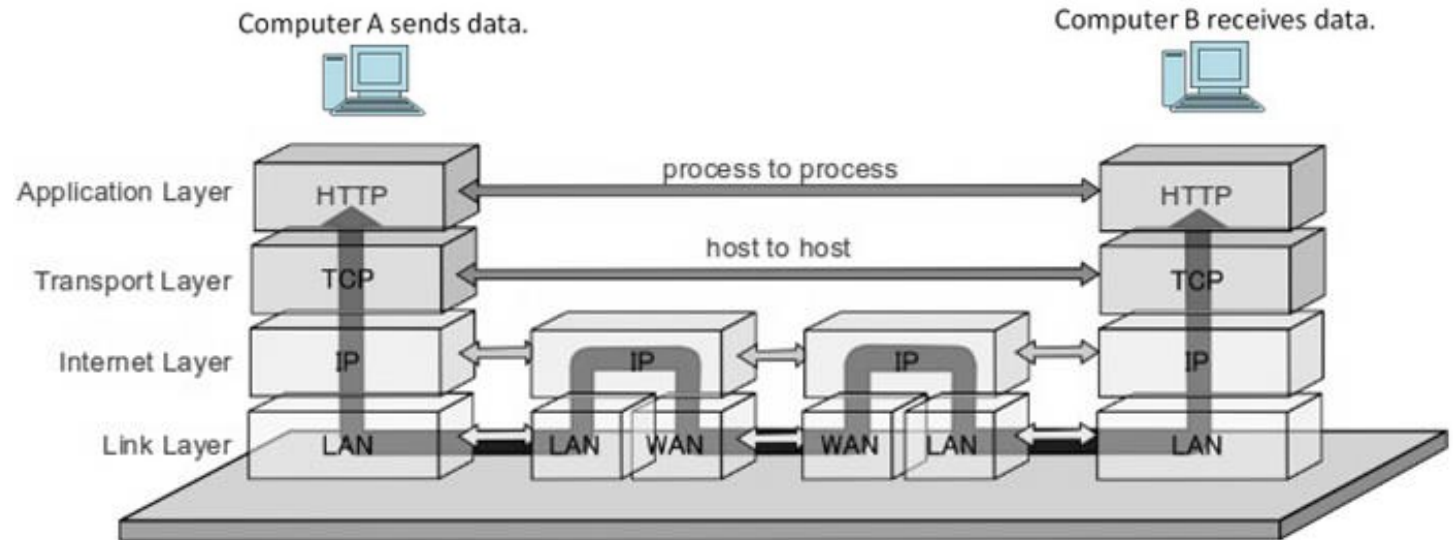

HTTP/1.1 200 OK	Status Line
Date: Thu, 20 May 2004 21:12:58 GMT	General Headers
Connection: close	
Server: Apache/1.3.27	Response Headers
Accept-Ranges: bytes	
Content-Type: text/html	Entity Headers
Content-Length: 170	
Last-Modified: Tue, 18 May 2004 10:14:49 GMT	
<pre> <html> <head> <title>Welcome to the Amazing Site!</title> </head> <body> <p>This site is under construction. Please come back later. Sorry!</p> </body> </html> </pre>	
	Message Body

HTTP Response

HTTP Request/Response Message Format

Transport Layer Protocols

- TCP (Transmission Control Protocol)
 - TCP provides a reliable, point-to-point communication channel for clients and servers to communicate over the Internet
 - TCP is the protocol used most on top of IP, we often referred to as TCP/IP
- UDP (User Datagram Protocol)
 - contains a minimum amount of communication mechanisms (no acknowledgement, unreliable)

<https://www.elprocus.com/tcp-ip-protocol-architecture-and-its-layers/>

An abstract graphic on the left side of the slide, featuring concentric circles and digital patterns in shades of blue, green, and white, resembling a stylized network or data flow.

Lecture 8

- Network Basics
- Network Protocols
- Socket Programming
- Getting Web Data

Socket

- To communicate, a client program and a server program establish a connection to one another
- Each program binds a **socket** to its end of the connection
- A socket is one **endpoint** of a two-way communication link between two programs running on the network.
 - Endpoint: IP address + Port number
- To communicate, the client and the server each reads from and writes to the socket bound to the connection.

<https://examradar.com/java-networking-network-basics-socket-overview/>

Socket

- The `java.net` package provides a powerful and flexible infrastructure for networking, providing various classes and interfaces that execute the low-level communication features

```
Socket(String host, int port)
```

Creates a stream socket and connects it to the specified port number on the named host.

```
ServerSocket(int port)
```

Creates a server socket, bound to the specified port.

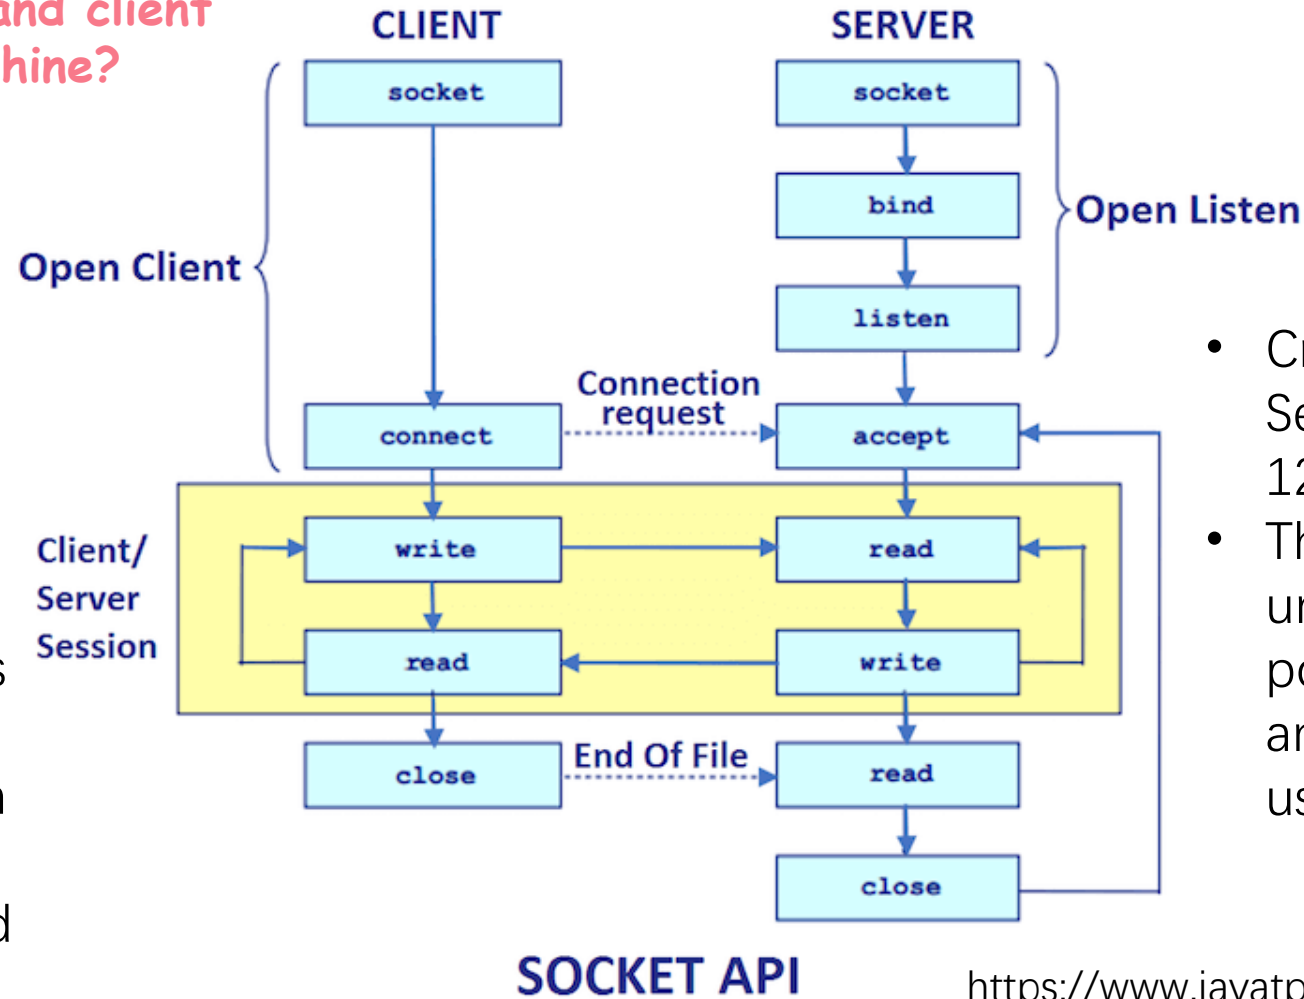

<https://examradar.com/java-networking-network-basics-socket-overview/>

```
Socket s = new Socket("www.serverip.com", 1234);
```

```
ServerSocket ss = new ServerSocket(1234);  
Socket s = ss.accept();
```

What if the server and client run on the same machine?

- Create an instance of Socket by passing the IP or hostname of the server and a port number
- If the connection fails, an Exception is thrown
- Otherwise, establish the connection and use Socket s to read and write.

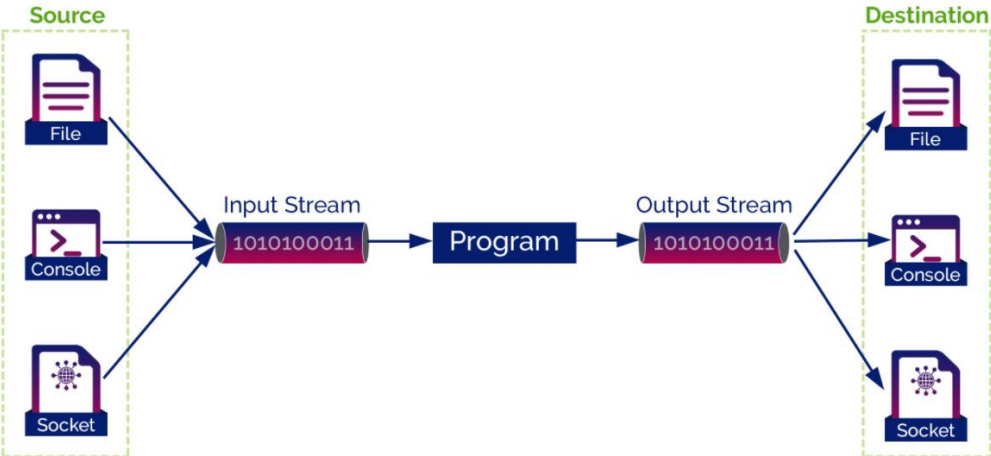

- Create an instance of ServerSocket by binding to 1234 port number
- The accept() method waits until a client connects to port 1234, and if so, return an instance of Socket that is used for reading and writing.

<https://www.javatpoint.com/socket-programming>

Reading from and Writing to a Socket

- After establishing the connection, we can use `socket.getInputStream()` and `socket.getOutputStream()` for both the client and the server

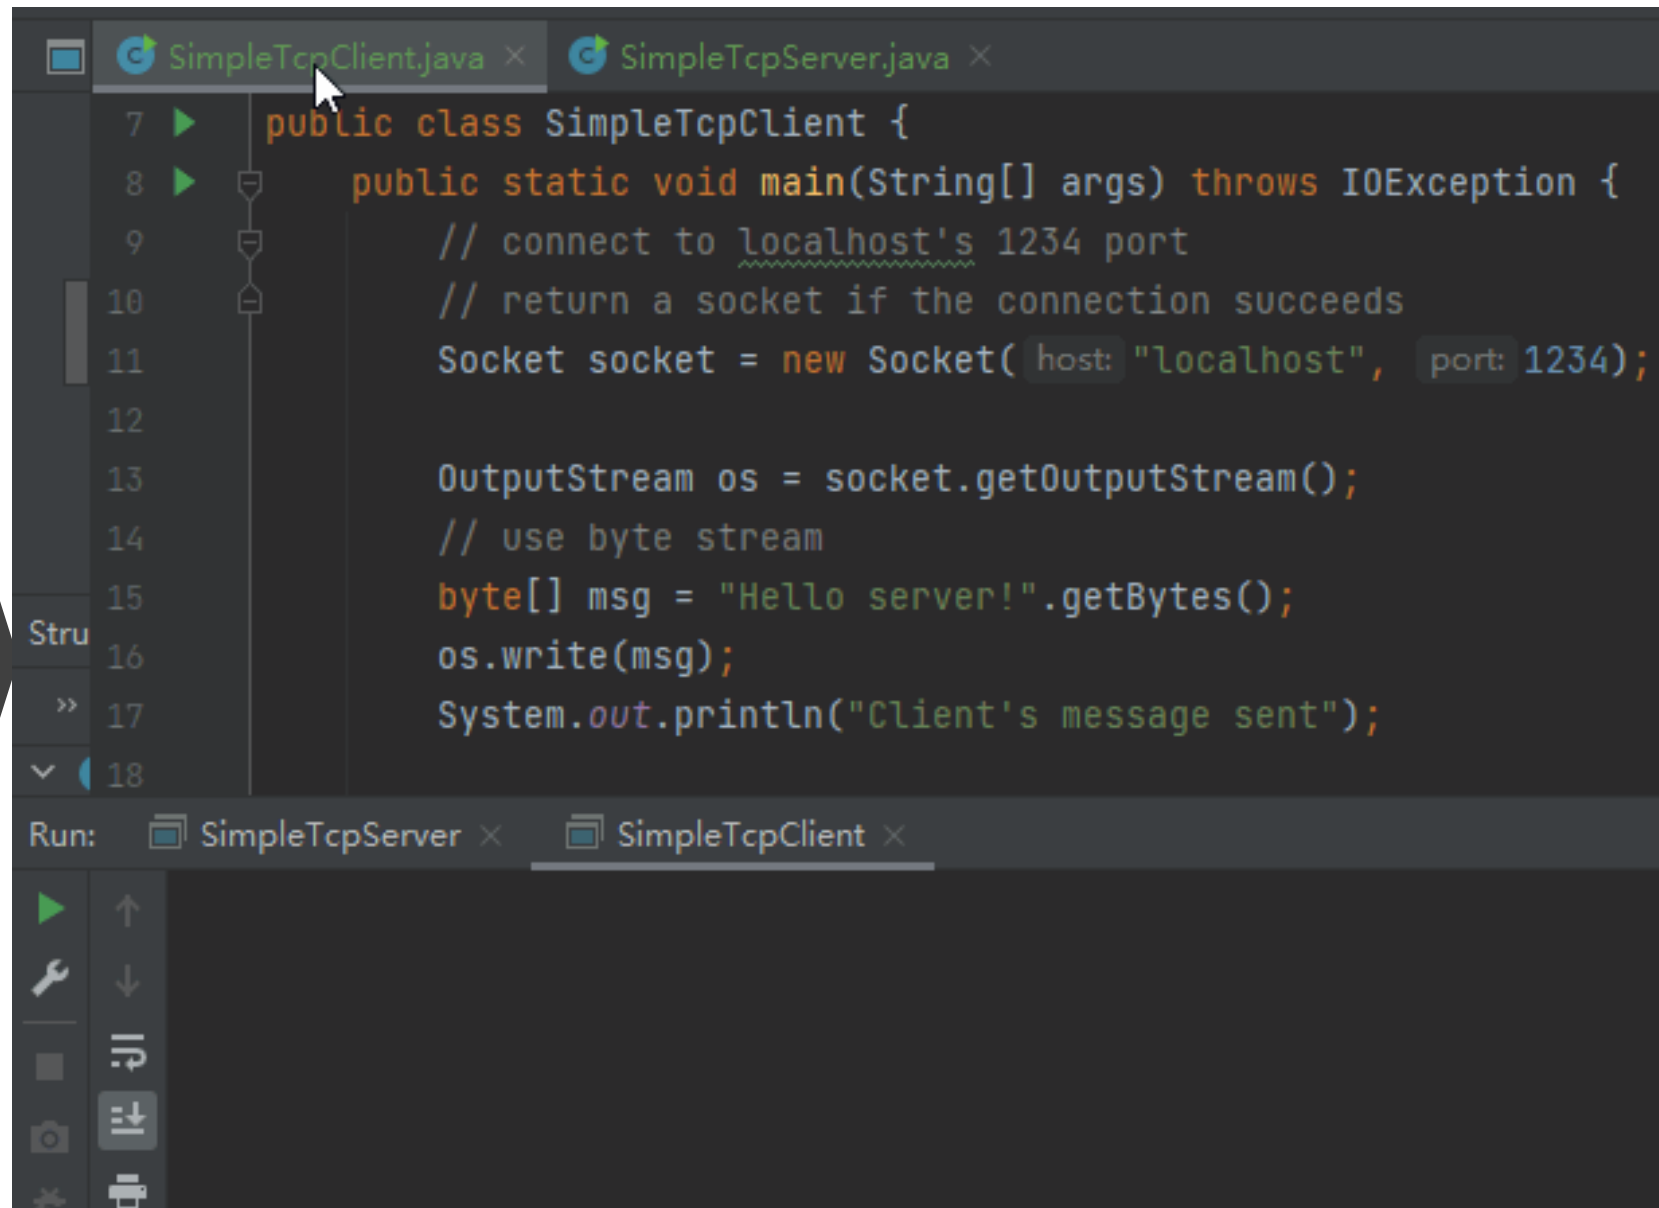

A Toy Example: Client

```
public class SimpleTcpClient {  
    public static void main(String[] args) throws IOException {  
        // connect to localhost's 1234 port  
        // return a socket if the connection succeeds  
        Socket socket = new Socket(host: "localhost", port: 1234);  
  
        OutputStream os = socket.getOutputStream();  
        // use byte stream  
        byte[] msg = "Hello server!".getBytes();  
        os.write(msg);  
        System.out.println("Client's message sent");  
  
        // closing the OutputStream will close the associated socket.  
        os.close();  
    }  
}
```

A Toy Example: Server

```
public class SimpleTcpServer {  
    public static void main(String[] args) throws IOException {  
        // Listen to port 1234  
        ServerSocket serverSocket = new ServerSocket(port: 1234);  
  
        // accept() blocks until a client connects  
        // if a client connects successfully, return a Socket instance  
        System.out.println("Waiting for client.....");  
        Socket socket = serverSocket.accept();  
        System.out.println("Client connected.");  
  
        // use the socket's inputStream to read message from the client  
        InputStream inputStream = socket.getInputStream();  
        // get client msg as bytes and print it  
        byte[] buf = new byte[1024];  
        int readLen = 0;  
        while((readLen = inputStream.read(buf)) != -1){  
            System.out.println(new String(buf, offset: 0, readLen));  
        }  
  
        // closing the InputStream will close the associated socket  
        inputStream.close();  
        serverSocket.close();  
    }  
}
```

A Toy Example

```
SimpleTcpClient.java x SimpleTcpServer.java x
7 public class SimpleTcpClient {
8     public static void main(String[] args) throws IOException {
9         // connect to localhost's 1234 port
10        // return a socket if the connection succeeds
11        Socket socket = new Socket(host: "localhost", port: 1234);
12
13        OutputStream os = socket.getOutputStream();
14        // use byte stream
15        byte[] msg = "Hello server!".getBytes();
16        os.write(msg);
17        System.out.println("Client's message sent");
18    }
}
```

Run: SimpleTcpServer x SimpleTcpClient x

Why “Toy” Examples?

- The toy server reads only 1 message then exits; In practice, server keeps running
- The toy client/server handles byte directly, which is cumbersome
- In practice, servers need to support multiple clients at the same time

More practical: We could use threads on server side: whenever a client request comes, a separate thread is assigned for handling each request

Case Study: Banking Service

```
© BankAccount
  m BankAccount()
  m BankAccount(double)
  m deposit(double): void
  m withdraw(double): void
  m getBalance(): double
  f balance: double
```

- A bank account has a balance that can be changed by deposits and withdrawals.

```
public synchronized void deposit (double amount) {
    balance = balance + amount;
    notifyAll();
}
```

Wakes up all threads that are waiting on this object's monitor.

```
public synchronized void withdraw (double amount) {
    try {
        while (balance < amount) wait();
        balance = balance - amount;
    } catch (InterruptedException e) {}
}
```

Causes the current thread to wait until another thread invokes the notify() method or the notifyAll() method for this object.

deposit() and withdraw() are properly synchronized

Case Study: Banking Service

	Bank
	Bank(int)
	deposit(int, double): void
	withdraw(int, double): void
	getBalance(int): double
	accounts: BankAccount[]

- A bank has multiple bank accounts
- A bank can withdraw from or deposit to a certain account

```
public class Bank {  
    private BankAccount[] accounts;  
  
    /**  
     * Constructs a bank account with a given number of accounts.  
     * @param size the number of accounts  
     */  
    public Bank (int size) {  
        accounts = new BankAccount[size];  
        for (int i = 0; i < accounts.length; i++) {  
            accounts[i] = new BankAccount();  
        }  
    }  
}
```

Case Study: Banking Service

c	Bank
m	Bank(int)
m	deposit(int, double): void
m	withdraw(int, double): void
m	getBalance(int): double
f	accounts: BankAccount[]

- A bank has multiple bank accounts
- A bank can withdraw from or deposit to a certain account

```
public void deposit (int accountNumber, double amount) {  
    BankAccount account = accounts[accountNumber];  
    account.deposit( amount);  
}
```

```
public void withdraw (int accountNumber, double amount) {  
    BankAccount account = accounts[accountNumber];  
    account.withdraw( amount);  
}
```

```
public double getBalance (int accountNumber) {  
    BankAccount account = accounts[accountNumber];  
    return account.getBalance();  
}
```

Banking Service Protocol

Table 2 A Simple Bank Access Protocol

Client Request	Server Response	Description
BALANCE n	n and the balance	Get the balance of account n
DEPOSIT n a	n and the new balance	Deposit amount a into account n
WITHDRAW n a	n and the new balance	Withdraw amount a from account n
QUIT	None	Quit the connection

Whenever you develop a server application, you need to specify some application-level protocol that clients can use to interact with the server

Bank Server

```
public class BankServer {  
    public static void main (String[] args) throws IOException {  
        final int ACCOUNTS_LENGTH = 10;  
        Bank bank = new Bank( ACCOUNTS_LENGTH);  
        final int SBAP_PORT = 8888;  
        ServerSocket server = new ServerSocket( SBAP_PORT);  
  
        System.out.println( "Waiting for clients to connect..." );  
        while (true) {  
            Socket s = server.accept();  
            System.out.println( "Client connected." );  
            BankService service = new BankService( s, bank);  
            Thread t = new Thread( service);  
            t.start();  
        }  
    }  
}
```

Case Study: Banking Service

	BankService
	Runnable
	run(): void
	BankService(Socket, Bank)
	doService(): void
	executeCommand(String): void
	s: Socket
	in: Scanner
	out: PrintWriter
	bank: Bank

- A bank service executes the banking service protocol

```
public class BankService implements Runnable {
    private Socket s;
    private Scanner in;
    private PrintWriter out;
    private Bank bank;

    /**
     * Constructs a service object that processes commands
     * from a socket for a bank.
     * @param aSocket the socket
     * @param aBank the bank
     */
    public BankService (Socket aSocket, Bank aBank) {
        s = aSocket;
        bank = aBank;
    }
}
```

Case Study: Banking Service

	BankService
	Runnable
	run(): void
	BankService(Socket, Bank)
	doService(): void
	executeCommand(String): void
	s: Socket
	in: Scanner
	out: PrintWriter
	bank: Bank

```
public void run() {
    try {
        try {
            in = new Scanner( s.getInputStream());
            out = new PrintWriter( s.getOutputStream());
            doService();
        } finally {
            s.close();
        }
    } catch (IOException exception) {
        exception.printStackTrace();
    }
}

/**
 * Executes all commands until the QUIT command or the
 * end of input.
 */
public void doService() throws IOException {
    while (true) {
        if (!in.hasNext()) return;
        String command = in.next();
        if ("QUIT".equals(command)) return;
        executeCommand( command);
    }
}
```

Case Study: Banking Service

BankService

▼

Runnable

run(): void

BankService(Socket, Bank)

doService(): void

executeCommand(String): void

s: Socket

in: Scanner

out: PrintWriter

bank: Bank

```
public void executeCommand (String command) {  
    int account = in.nextInt();  
    double amount;  
    switch (command) {  
        case "DEPOSIT" :  
            amount = in.nextDouble();  
            bank.deposit( account, amount);  
            break;  
        case "WITHDRAW" :  
            amount = in.nextDouble();  
            bank.withdraw( account, amount);  
            break;  
        case "BALANCE" :  
            break;  
        default:  
            out.println( "Invalid command" );  
            out.flush();  
            return;  
    }  
    out.println( account + " " + bank.getBalance( account) );  
    out.flush();  
}
```

Table 2 A Simple Bank Access Protocol

Client Request	Server Response	Description
BALANCE n	n and the balance	Get the balance of account n
DEPOSIT n a	n and the new balance	Deposit amount a into account n
WITHDRAW n a	n and the new balance	Withdraw amount a from account n
QUIT	None	Quit the connection

Bank Client

```
public class BankClient {  
    public static void main (String[] args) throws IOException {  
        final int SBAP_PORT = 8888;  
        try (Socket s = new Socket( host: "localhost", SBAP_PORT)) {  
            InputStream instream = s.getInputStream();  
            OutputStream outstream = s.getOutputStream();  
            Scanner in = new Scanner( instream);  
            PrintWriter out = new PrintWriter( outstream);
```

To communicate with the server by sending and receiving text, you could turn the streams into scanners and writers

Bank Client

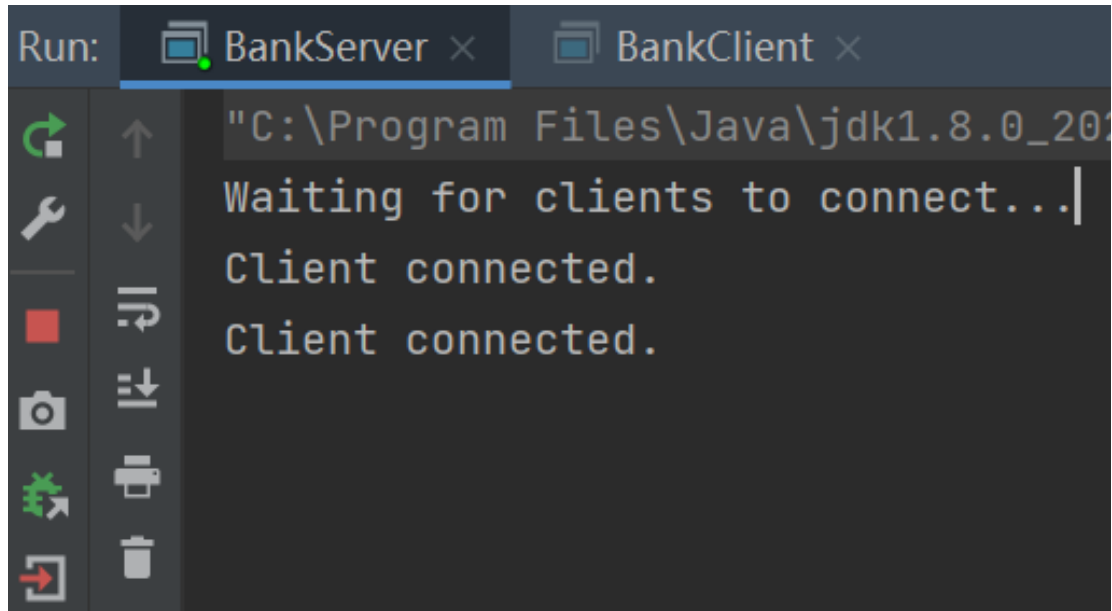

The flush method empties the buffer and forwards all waiting characters to the destination.

```
String command = "DEPOSIT 3 1000";
System.out.println( "Sending: " + command);
out.println( command );
out.flush();
String response = in.nextLine();
System.out.println( "Receiving: " + response);

command = "WITHDRAW 3 500";
System.out.println( "Sending: " + command);
out.println( command );
out.flush();
response = in.nextLine();
System.out.println( "Receiving: " + response);

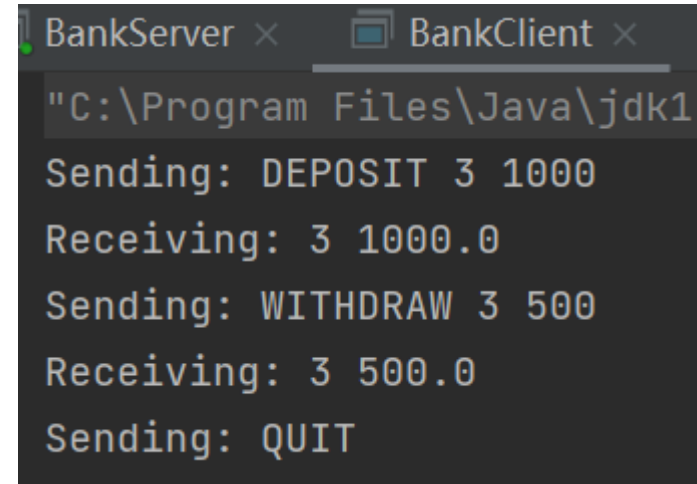

command = "QUIT";
System.out.println( "Sending: " + command);
out.println( command );
out.flush();
```

Case Study

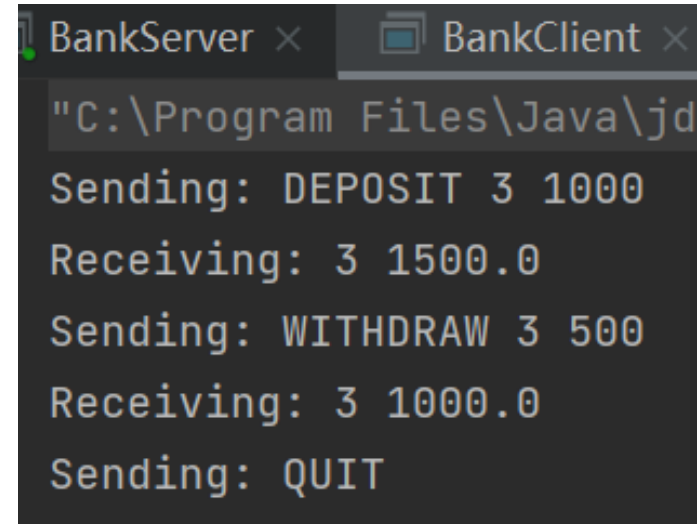

```
Run: BankServer x BankClient x
"C:\Program Files\Java\jdk1.8.0_201\bin\java.exe" -Djava.class.path=.;\lib\BankServer.jar BankServer
Waiting for clients to connect...
Client connected.
Client connected.
```

Server keeps running

```
BankServer x BankClient x
"C:\Program Files\Java\jdk1.8.0_201\bin\java.exe" -Djava.class.path=.;\lib\BankClient.jar BankClient
Sending: DEPOSIT 3 1000
Receiving: 3 1000.0
Sending: WITHDRAW 3 500
Receiving: 3 500.0
Sending: QUIT
```

```
BankServer x BankClient x
"C:\Program Files\Java\jdk1.8.0_201\bin\java.exe" -Djava.class.path=.;\lib\BankClient.jar BankClient
Sending: DEPOSIT 3 1000
Receiving: 3 1500.0
Sending: WITHDRAW 3 500
Receiving: 3 1000.0
Sending: QUIT
```

An abstract graphic on the left side of the slide, featuring concentric circles and various digital patterns like binary code and pixelated shapes in shades of blue, green, and white.

Lecture 8

- Network Basics
- Network Protocols
- Socket Programming
- **Getting Web Data**
 - java.net package
 - Web scraping libraries
 - REST API

Fetching a web page with socket

```
// Open socket
final int HTTP_PORT = 80;
try (Socket s = new Socket( host, HTTP_PORT)) {
    // Get streams
    InputStream instream = s.getInputStream();
    OutputStream outstream = s.getOutputStream();

    // Turn streams into scanners and writers
    Scanner in = new Scanner( instream);
    PrintWriter out = new PrintWriter( outstream);

    // Send command
    String command = "GET " + resource + " HTTP/1.1\n" +
        "Host: " + host + "\n\n";
    out.print( command );
    out.flush();

    // Read server response
    while (in.hasNextLine()) {
        String input = in.nextLine();
        System.out.println( input);
    }
} // The try-with-resources statement closes the socket
```

The client establish a Socket with the server. The socket constructor throws an `UnknownHostException` if it can't find the host.

`InputStream` and `OutputStream` classes are used for reading and writing bytes. If you want to communicate with the server by sending and receiving text, you should turn the streams into scanners and writers

A print writer buffer characters. We need to flush the buffer manually so that the server get a complete request

Receive responses from the server

Fetching a web page with socket

```
// Open socket
final int HTTP_PORT = 80;
try (Socket s = new Socket( host, HTTP_PORT)) {
    // Get streams
    InputStream instream = s.getInputStream();
    OutputStream outstream = s.getOutputStream();

    // Turn streams into scanners and writers
    Scanner in = new Scanner( instream);
    PrintWriter out = new PrintWriter( outstream);

    // Send command
    String command = "GET " + resource + " HTTP/1.1\n" +
        "Host: " + host + "\n\n";
    out.print( command );
    out.flush();

    // Read server response
    while (in.hasNextLine()) {
        String input = in.nextLine();
        System.out.println( input);
    }
} // The try-with-resources statement closes the socket
```

Problems

- We have to handle socket connections and socket errors by ourselves
- We have to manually create HTTP requests with the correct format
- We have to manually parse HTTP responses

To access web servers in Java, we want to work **at a higher level** than socket connections and HTTP requests

URLConnection

- Java contains a `URLConnection` class (`java.net` package), which provides convenient support for the HTTP
- The `URLConnection` class takes care of the socket connection, so you do not have to fuss with sockets when you want to retrieve from a web server.
- As an additional benefit, the `URLConnection` class can also handle FTP, the file transfer protocol.

Fetching a web page with URLConnection

```
String url = "https://www.sustech.edu.cn";
```

```
public static void readByURLConnection(String url) throws IOException {
    URL u = new URL(url);
    // Open connection
    URLConnection conn = u.openConnection();
    // For HTTP an HttpURLConnection will be returned
    HttpURLConnection httpConn = (HttpURLConnection) conn;

    // Check response code and status
    int code = httpConn.getResponseCode();
    String msg = httpConn.getResponseMessage();
    System.out.println(code + " " + msg);
    if(code != HttpURLConnection.HTTP_OK){
        return;
    }

    // Read server response
    InputStream istream = httpConn.getInputStream();
    Scanner in = new Scanner(istream);
    while (in.hasNextLine()){
        System.out.println(in.nextLine());
    }
}
```

Fetching a web page with URLConnection

```
String url = "https://www.sustech.edu.cn";
```

```
200 OK

Fetching a web page with HttpClient

The `java.net.http.HttpClient` API provides an even simpler way to connect to a web server (Java 11)

```
public static void readByHttpClient(String url) throws
    IOException, InterruptedException {
    HttpClient client = HttpClient.newHttpClient();
    HttpRequest request = HttpRequest.newBuilder()
        .uri(URI.create(url))
        .GET()
        .build();

    HttpResponse<String> response = client.send(request,
        HttpResponse.BodyHandlers.ofString());

    System.out.println(response.body());
}
```

java.net package

Provides the classes for implementing networking applications.

The java.net package can be roughly divided in two sections:

- *A Low Level API*, which deals with the following abstractions:
 - *Addresses*, which are networking identifiers, like IP addresses.
 - *Sockets*, which are basic bidirectional data communication mechanisms.
 - *Interfaces*, which describe network interfaces.
- *A High Level API*, which deals with the following abstractions:
 - *URIs*, which represent Universal Resource Identifiers.
 - *URLs*, which represent Universal Resource Locators.
 - *Connections*, which represents connections to the resource pointed to by *URLs*.

https://docs.oracle.com/javase/7/docs/api/java/net/package-summary.html#package_description

Lecture 8

- Network Basics
- Network Protocols
- Socket Programming
- **Getting Web Data**
 - java.net package
 - Web scraping libraries
 - REST API

Web Scraping

- Web scraping refers to the process of extracting of data from websites.
- Typically using bots/spiders to automatically navigate through web pages and extract data

<https://www.development-tutorial.com/basic-structure-html-page/>

How are web pages created?

<https://www.etutorialspoint.com/index.php/basic-html/html-elements>

- HTML (Hypertext Markup Language): a hypertext markup language for creating web pages
- HTML uses tags for titles, headings, paragraphs, lists, tables, embedded images, etc., to describe the structure of a web page

Inspecting the HTML for an element

The screenshot shows a web browser window with the URL `stackoverflow.com/questions/27872387/can-a-java-lambda-have-more-than-1-parameter`. The page features the Stack Overflow logo, a search bar, and a left sidebar with navigation links: Home, PUBLIC, Questions (selected), Tags, Users, COLLECTIVES, Explore Collectives, FIND A JOB, Jobs, Companies, and TEAMS. The main content area displays the question title "Can a java lambda have more than 1 parameter?", its status (Asked 7 years, 2 months ago; Active 1 year ago; Viewed 153k times), and two answers. The first answer, by user 188, states "In Java, is it possible to have a lambda accept multiple different types?" and "I.e: Single variable works:", followed by a code snippet:

```
Function <Integer, Integer> adder = i -> i + 1;
System.out.println (adder.apply (10));
```

 The second answer, by user 50, states "Varargs also work:" and includes a code snippet:

```
Function <Integer [], Integer> multiAdder = ints -> {
    int sum = 0;
    for (Integer i : ints) {
        sum += i;
    }
}
```

What if we want
to find the html
element for a
specific part?

Inspecting the HTML for an element

The screenshot shows a web browser displaying a Stack Overflow question. The browser's address bar shows the URL: `stackoverflow.com/questions/27872387/can-a-java-lambda-have-more-than-1-parameter`. The Stack Overflow logo and navigation links are visible at the top. The question title is "Can a java lambda have more than 1 parameter?". Below the title, it says "Asked 7 years, 2 months ago", "Active 1 year ago", and "Viewed 153k times". The question body contains two parts: "In Java, is it possible to have a lambda accept multiple different types?" and "I.e: Single variable works:". Below this, there is a code snippet:

```
Function <Integer, Integer> adder = i -> i + 1;
System.out.println (adder.apply (10));
```

 followed by "Varargs also work:" and another code snippet:

```
Function <Integer [], Integer> multiAdder = ints -> {
    int sum = 0;
    for (Integer i : ints) {
        sum += i;
    }
    return sum;
};
```

 The right sidebar contains "The Overflow Blog" with two articles and "Featured on Meta" with three items. The left sidebar shows navigation links like Home, PUBLIC, Questions, Tags, Users, COLLECTIVES, Explore Collectives, FIND A JOB, Jobs, Companies, TEAMS, and Stack Overflow for Teams.

Can a java lambda have more than 1 parameter?

Asked 7 years, 2 months ago Active 1 year ago Viewed 153k times

188 In Java, is it possible to have a lambda accept multiple different types?

I.e: Single variable works:

```
Function <Integer, Integer> adder = i -> i + 1;
System.out.println (adder.apply (10));
```

50 Varargs also work:

```
Function <Integer [], Integer> multiAdder = ints -> {
    int sum = 0;
    for (Integer i : ints) {
        sum += i;
    }
    return sum;
};
```

The Overflow Blog

Static vs Dynamic Web Pages

- **Static web pages**
 - Server-side rendered HTML: web page is delivered to the user exactly as stored in the server
 - HTML is fixed
- **Dynamic web pages**
 - JavaScript rendered HTML: web page content is created dynamically using JS
 - HTML is changing (e.g., scrolling down a web page to get the news feed)
 - Needs other advanced scraping strategy/libraries

Java Libraries for Web Scrapping

1

Jsoup: this is a simple open-source library that provides very convenient functionality for extracting and manipulating data by using DOM traversal or CSS selectors to find data. It is beginner friendly.

2

HTMLUnit: is a more powerful framework that can allow you to simulate browser events such as clicking and forms submission when scraping and it also has JavaScript support.

3

Jaunt: can be used to extract data from HTML pages or JSON data payloads by using a headless browser. It has recently been updated to include JavaScript support.

Lecture 8

- Network Basics
- Network Protocols
- Socket Programming
- **Getting Web Data**
 - java.net package
 - Web scraping libraries
 - **REST API**

What is REST API?

- **API**
 - An interface for multiple programs to communicate with each other (e.g., public class and methods in `java.net`)
- **RESTful API**
 - A REST APIs is an API conforms to the constraints of REST architectural style
 - RESTful APIs are widely used in industry for communicating between clients and servers
- **REST**
 - **RE**presentational **S**tate **T**ransfer
 - REST is a software architectural style

What are the constraints of REST style?

REST Constraints

- **Client-server**: A client-server architecture made up of clients, servers, and resources (info like text, image, video)
- **Resources** could be accessed using URL
- **Stateless**: Resource requests should be made independently of one another
- Requests are made using **HTTP protocol**
 - GET: get resources
 - POST: create resources
 - PUT/PATCH: update resources
 - DELETE: delete resources

REST API IN ACTION

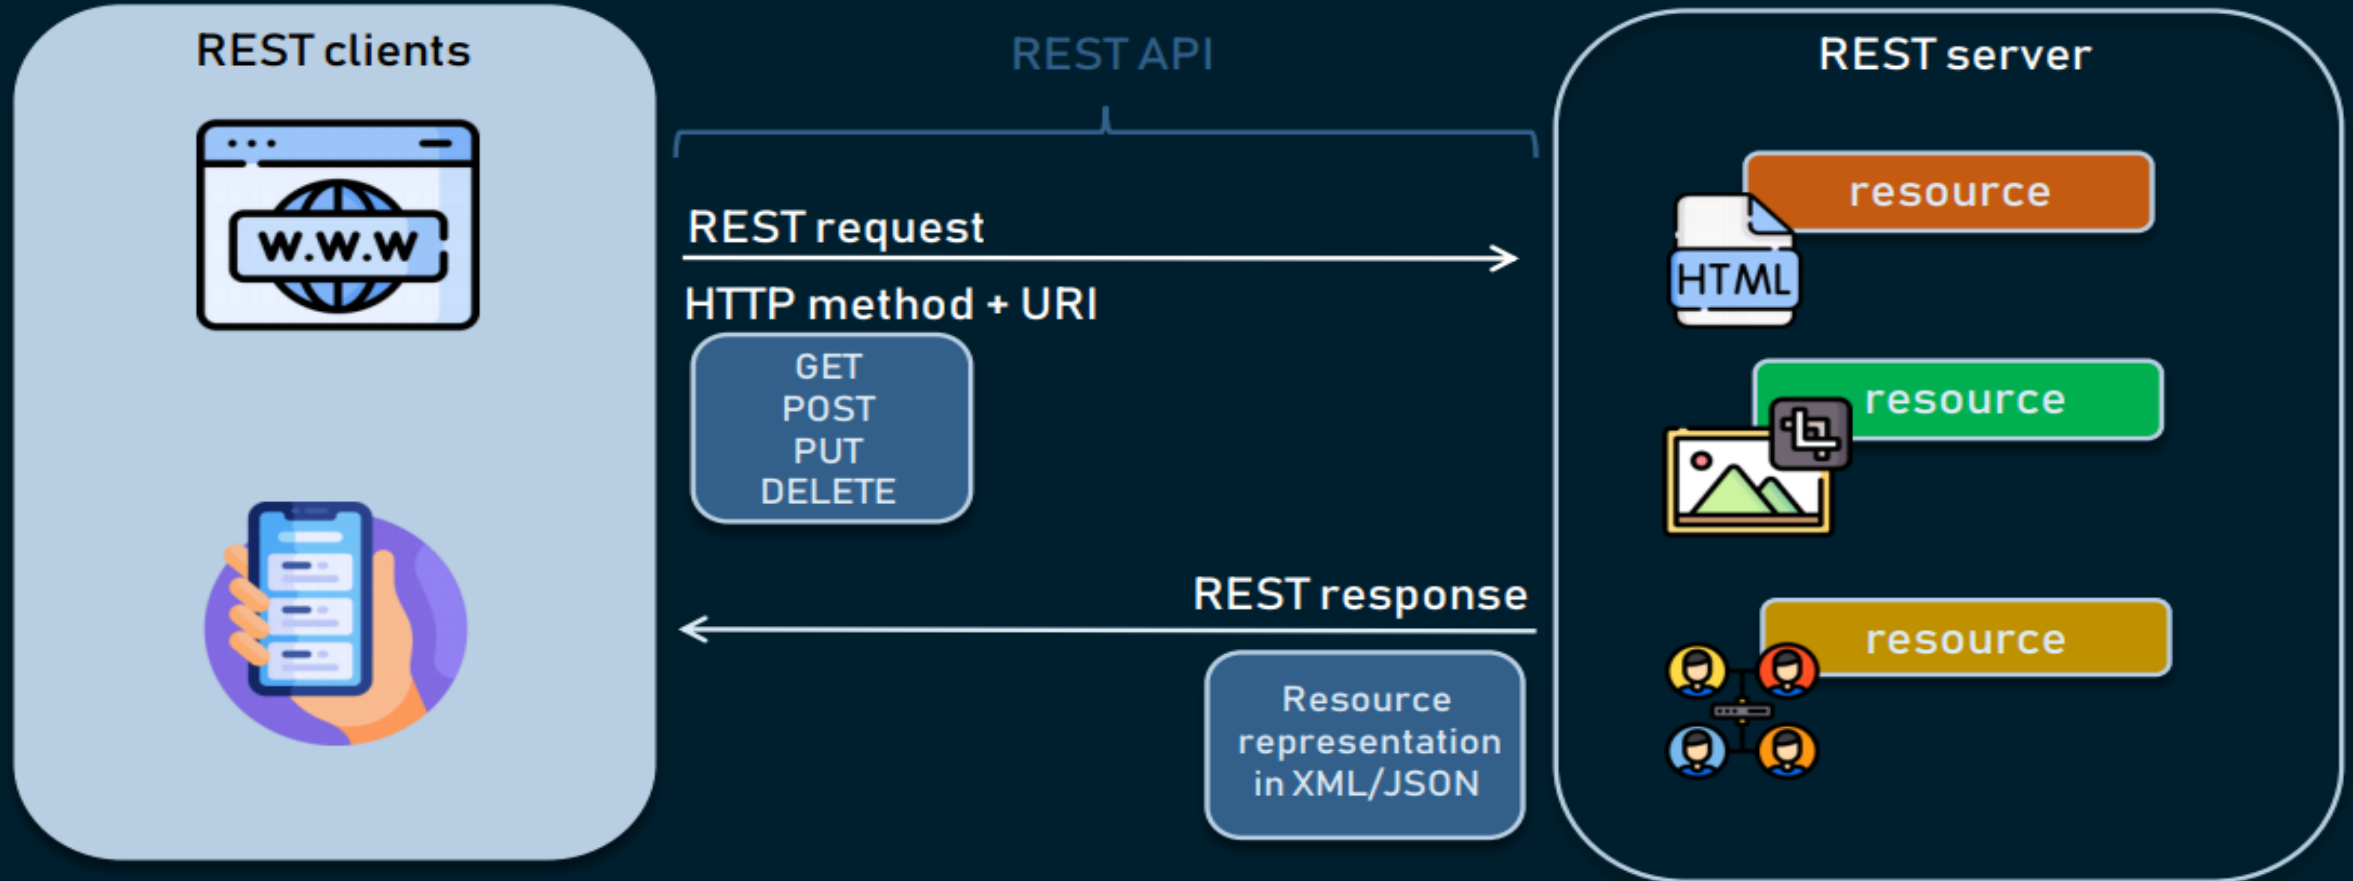

Image source: <https://www.altexsoft.com/blog/rest-api-design/>

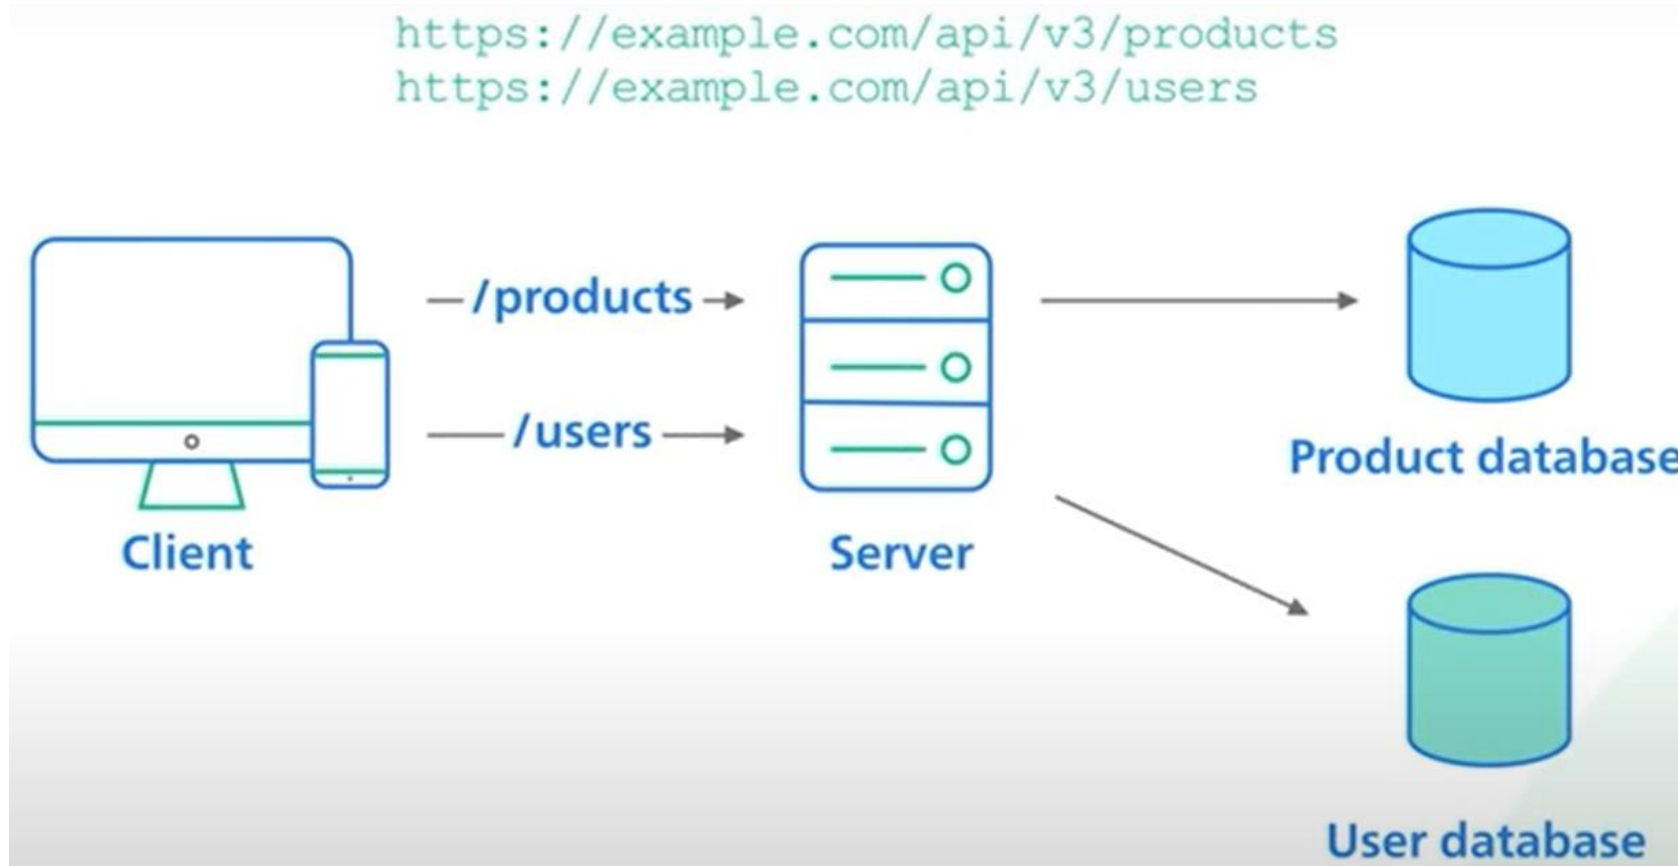

RESTful API Request Design

Request = Verb + Object

GET
PUT
PATCH
POST
DELETE

- Typically use noun in plural form indicating the resources, e.g., `questions`
- Allow parameters for filtering, e.g., `?limit=10`

RESTful API Request Design

Using **nouns** to differentiate different resources

GitHub REST API

URL: <https://api.github.com/>

Documentation: <https://docs.github.com/en/rest>

GET `/repos/{owner}/{repo}`

Get a repository info by its owner and repo name

<https://docs.github.com/en/rest/repos/repos#get-a-repository>

GET `/repos/{owner}/{repo}/contributors`

List repository contributors

POST `/repos/{owner}/{repo}/issues`

Create an issue (must have pull access to this repo)

PATCH `/repos/{owner}/{repo}/releases/{release_id}`

Update a release (must have push access to this repo)

GET `/search/topics`

Search for topics (should specify the topic using parameters)

Stack Overflow REST API

REST Service URL

Requested resource

Parameter

```
String s= "https://api.stackexchange.com/questions/27872387?site=stackoverflow";  
URL url = new URL(s);      java.net package  
URLConnection conn = (URLConnection)url.openConnection();  
conn.setRequestMethod("GET"); Request verb  
conn.connect();  
  
int responseCode = conn.getResponseCode();      200  
String responseMessage = conn.getResponseMessage();      OK  
String contentEncoding = conn.getContentEncoding();      gzip
```

Request Response

HTTP Status Code

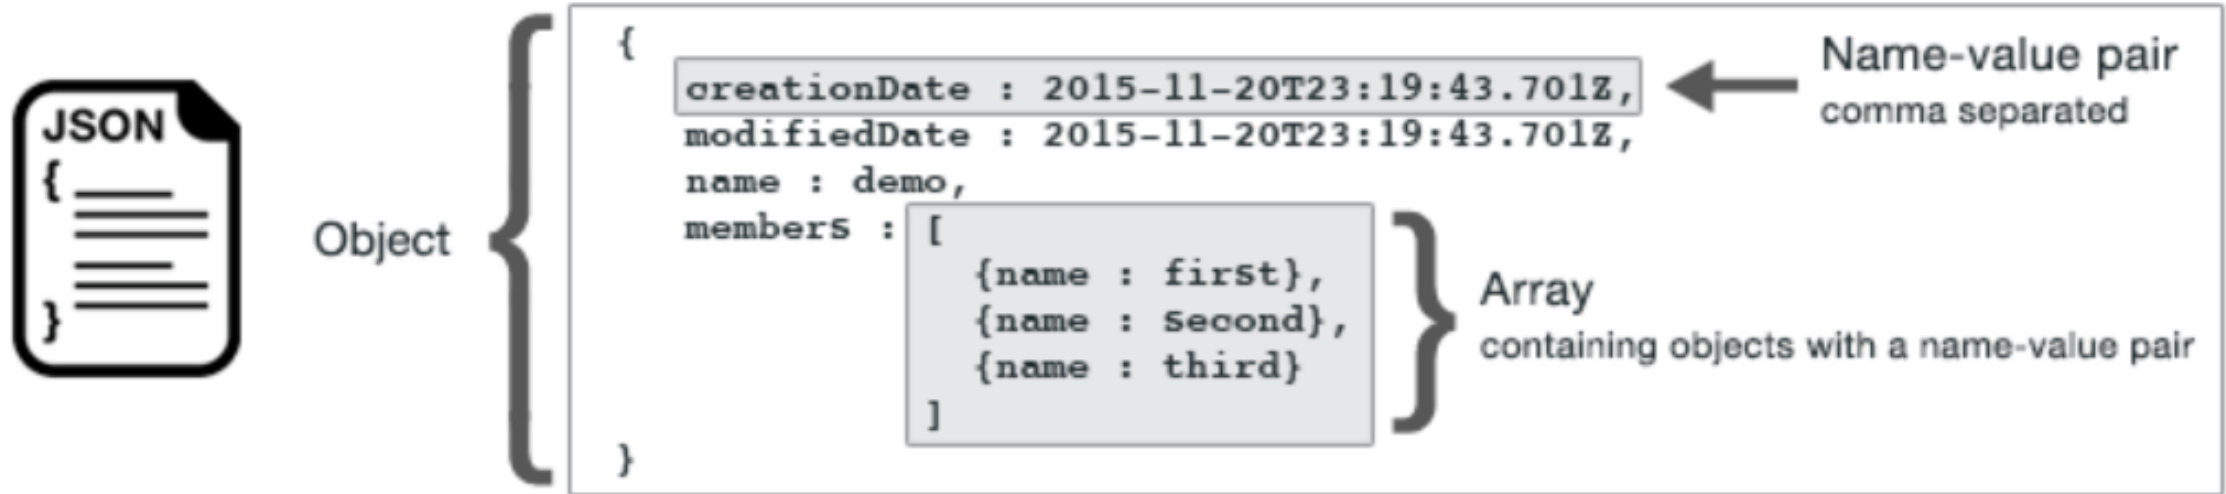

GET /repos/{owner}/{repo}

Status: 200 OK

```
{
  "id": 1296269,
  "node_id": "MDEwO1JlcG9zaXRvcnkxMjk2MjY5",
  "name": "Hello-World",
  "full_name": "octocat/Hello-World",
  "owner": {
    "login": "octocat",
    "id": 1,
    "node_id": "MDQ6VXNlcjE=",
    "avatar_url": "https://github.com/images/error/octocat_happy.gif",
    "gravatar_id": "",
    "url": "https://api.github.com/users/octocat",
    "html_url": "https://github.com/octocat",
    "followers_url": "https://api.github.com/users/octocat/followers",
    "following_url": "https://api.github.com/users/octocat/following{/other_user}",
    "gists_url": "https://api.github.com/users/octocat/gists{/gist_id}",
```

JSON format

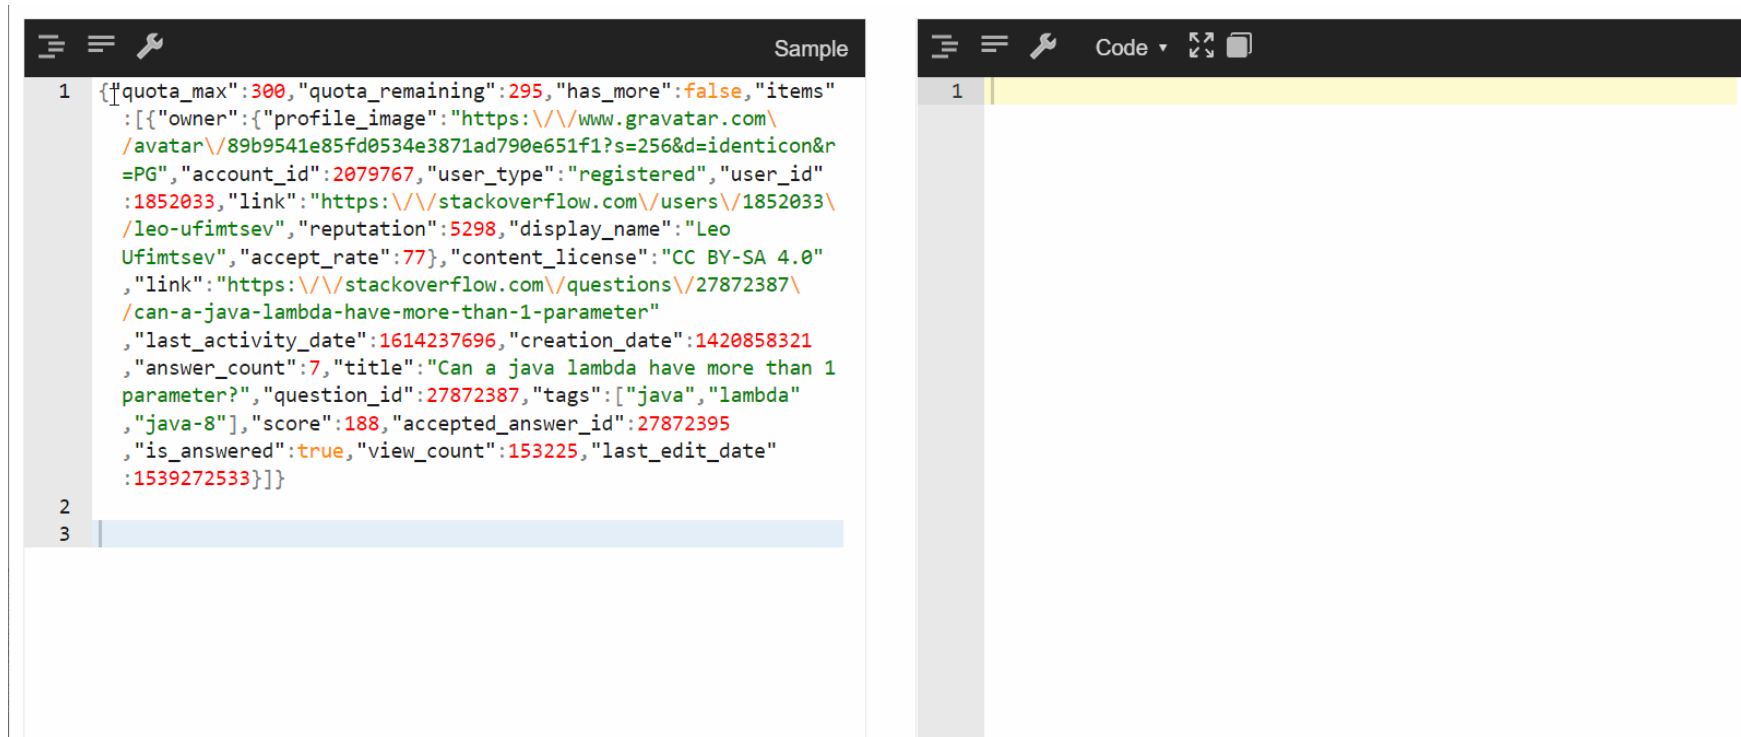

TAO Yida@SUSTECH

JSON

- JavaScript Object Notation
- An open data interchange format that is both human and machine-readable
- Independent of any programming language

JSON Helper Tools

- Java Libraries for parsing and creating JSON string: JSON-simple, GSON, Jackson, etc.
- JSON viewers (help formatting the JSON string)

Type <https://api.github.com/repos/spring-projects/spring-boot> in your browser and see what happens
